Nothing in the analysis is geometrically parallel to anything else. Although you can use parallel computations to perform a simulation study, I doubt Horn was thinking about that in 1965. My best guess is that is Horn's method is a secondary analysis that is performed "off to the side" or "in parallel" to the primary principal component analysis.

RE-ENTRY MOTION OF AN AXIALSYMMETRIC VEHICLE AND ITS ANALYSIS BASED ON FLIGHT SIMULATION The position of the center of pressure can be a crucial point in the static stability of the vehicle. When the location of the center of pressure falls between the center of gravity and the nose of the vehicle static instability may occur during the flight.
